### Command description

Table 1 is the command table. The SED1520 series identifies a data bus using a combination of A0 and R/ $\overline{w}$  (RD or  $\overline{WR}$ ) signals. As the MPU translates a command in the internal timing only (independent from the external clock). Its speed is very high. The busy check is usually not required.

### Display ON/OFF

A0	$\frac{E}{RD}$	$\frac{R/\overline{w}}{\overline{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	0	1	0	1	1	1	D	AEH,AFH

This command turns the display on and off.

- D=1: Display ON
- D=0: Display OFF

### Display Start Line

This command specifies the line address shown in Figure 1 and indicates the display line that corresponds to COM0. The display area begins at the specified line address and continues in the line address increment direction. This area having the number of lines of the specified display duty is displayed. If the line address is changed dynamically by this command the vertical smooth scrolling and paging can be used.

A0	$\frac{E}{RD}$	$\frac{R/\overline{w}}{\overline{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	1	0	A4	A3	A2	A1	A0	COH,DFH

This command loads the display start line register.

A4	A3	A2	A1	A0	Line Address
0	0	0	0	0	0
0	0	0	0	1	1
		⋮			⋮
		⋮			⋮
1	1	1	1	1	31

See Figure 1.

### Set Page Address

This command specifies the page address that corresponds to the low address of the display data RAM when it is accessed by the MPU. Any bit of the display data RAM can be accessed when its page address and column address are specified. The display status is not changed even when the page address is changed.

A0	$\frac{E}{RD}$	$\frac{R/\overline{w}}{\overline{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	0	1	1	1	0	A1	A0	B8H,BBH

**POWERTIP TECHNOLOGY CORPORATION**

DISPLAY DEVICES FOR BETTER ELECTRONIC DESIGN

This command loads the page address register.

A1	A0	Page
0	0	0
0	1	1
1	0	2
1	1	3

### Set column Address

This command specifies a column address of the display data RAM. When the display data RAM is accessed by the MPU continuously, the column address is incremented by 1 each time it is accessed from the set address. Therefore, the MPU can access to data continuously. The column address stops to be incremented at address 80, and the page address is not changed continuously.

A0	E	R/ $\overline{W}$	D7	D6	D5	D4	D3	D2	D1	D0	
	$\overline{RD}$	$\overline{WR}$									
0	1	0	0	A6	A5	A4	A3	A2	A1	A0	00H,4FH

This command loads the column address register.

A6	A5	A4	A3	A2	A1	A0	Line Address
0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	1
			⋮				⋮
			⋮				⋮
1	0	0	1	1	1	1	79

### Read Status

A0	E	R/ $\overline{W}$	D7	D6	D5	D4	D3	D2	D1	D0
	호류	$\overline{WR}$								
0	0	1	BUSY	ADC	ON/OFF	RESE T	0	0	0	0

Reading the command I/O register (A0=0) yields system status information.

- The busy bit indicates whether the driver will accept a command or not.  
Busy=1: The driver is currently executing a command or is resetting. No new command will be accepted.  
Busy=0: The driver will accept a new command.
- The ACD bit indicates the way column addresses are assigned to segment drivers.  
ADC=1: Normal. Column address n → segment driver n.  
ADC=0: Inverted. Column address 79-u → segment driver u.
- The ON/OFF bit indicates the current status of the display.

**POWERTIP TECHNOLOGY CORPORATION**

DISPLAY DEVICES FOR BETTER ELECTRONIC DESIGN

It is the inverse of the polarity of the display ON/OFF command.

ON/OFF=1: Display OFF

ON/OFF=0: Display ON

- The RESET bit indicates whether the driver is executing a hardware or software reset or if it is in normal operating mode.

RESET=1: Currently executing reset command.

RESET=0: Normal operation

### Write Display Data

A0	$\overline{E}$ RD	$\overline{R/\overline{W}}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	Write data							

Writes 8-bit of data into the display data RAM, at a location specified by the contents of the column address and page address registers and then increments the column address register by one.

### Read Display Data

A0	$\overline{E}$ RD	$\overline{R/\overline{W}}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
1	0	1	Read data							

Reads 8-bits of data from the data I/O latch, updates the contents of the I/O latch with display data from the display data RAM location specified by the contents of the column address and page address registers and then

increments the column address register.

After loading a new address into the column address register one dummy read is required before valid data is obtained.

### Select ADC

A0	$\overline{E}$ RD	$\overline{R/\overline{W}}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	0	0	D

A0H, A1H

This command selects the relationship between display data RAM column addresses and segment drivers.

D=1: SEG0 ← column address 4FH,...(inverted)

D=0: SEG0 ← column address 00H,...(normal)

This command is provided to reduce restrictions on the placement of driver ICs and routing of traces during printed circuit board design. See Figure 1 for a table of segments and column addresses for the two values of D.

**Static Drive ON/OFF**

A0	$\overline{\text{RD}}$	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	0	1	0	0	1	0	D	A4H, ,A5H

Forces display on and all common outputs to be selected.

D=1: Static drive on

D=0: Static drive off

**Select Duty**

A0	$\overline{\text{RD}}$	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	0	1	0	1	0	0	D	A8H, ,A9H

This command sets the duty cycle of the LCD drive .

SED1520

D=1: 1/32 duty cycle

D=0: 1/16 duty cycle

**Read-Modify-Write**

A0	$\overline{\text{RD}}$	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	1	1	0	0	0	0	0	EOH

This command defeats column address register auto-increment after data reads. The current contents of the column address register are saved. This mode remains active until an End command is received.

- Operation sequence during cursor display

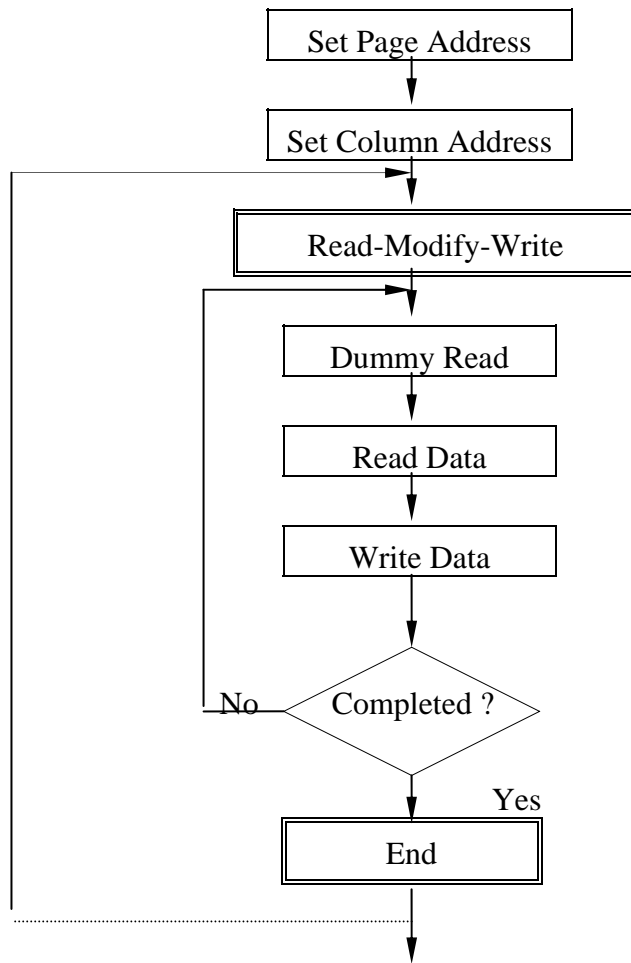

When the End command is entered, the column address is returned to the one used during input of Read-Modify-Write command. This function can reduce the load of MPU when data change is repeated at a specific display area (such as cursor blinking).

\* Any command other than Data Read or Write can be used in the Read-Modify-Write mode. However, the Column Address Set command cannot be used.

A0	$\overline{E}$ RD	$\overline{R/\overline{W}}$ WR	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	1	1	0	1	1	1	0	EEH

This command cancels read-modify-write mode and restores the contents of the column address register to their value prior to the receipt of the Read-Modify-Write command.

**Reset**

A0	$\overline{\text{RD}}$	$\overline{\text{R/W}}$	D7	D6	D5	D4	D3	D2	D1	D0

E2H

This command clears

- the display start line register.
- and set page address register to 3 page.

It does not affect the contents of the display data RAM.

When the power supply is turned on, a Reset signal is entered in the RES pin. The Reset command cannot be used instead of this Reset signal.
